- What is the class of maximal and timelike minimal Bour's surfaces of general value m in  $\mathbb{R}^{2,1}$ ?
- Are there any other implicit equations for CMC 1 Bour type surfaces? If there exist implicit equations, what are the corresponding degrees and classes?

Let

$$\mathbb{R}^{n,1} := (\{x = (x_1, \cdots, x_n, x_0)^t | x_i \in \mathbb{R}\}, \langle \cdot, \cdot \rangle)$$

be the (n+1)-dimensional Lorentz-Minkowski (for short, Minkowski) space with Lorentz metric

$$\langle x,y\rangle=x_1y_1+\cdots+x_ny_n-x_0y_0.$$

Then the 3-dimensional hyperbolic space  $\mathbb{H}^3$  and 3-dimensional de Sitter space  $\mathbb{S}^{2,1}$  are defined as follows:

$$\begin{split} \mathbb{H}^3 &:= \{x \in \mathbb{R}^{3,1} | \langle x, x \rangle = -1, \ x_0 > 0\} \cong \left\{ F \bar{F}^t | F \in \mathrm{SL}_2 \mathbb{C} \right\}, \\ \mathbb{S}^{2,1} &:= \{x \in \mathbb{R}^{3,1} | \langle x, x \rangle = 1\} \cong \left\{ F \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} \bar{F}^t | F \in \mathrm{SL}_2 \mathbb{C} \right\}. \end{split}$$

• A vector  $x \in \mathbb{R}^{n,1}$  is called spacelike if  $\langle x, x \rangle > 0$ , timelike if  $\langle x, x \rangle < 0$ , and lightlike if  $x \neq 0$  and  $\langle x, x \rangle = 0$ .

- A surface in  $\mathbb{R}^{n,1}$  is called spacelike (resp. timelike, lightlike) if the induced metric on the tangent planes is a positive definite Riemannian (resp. Lorentzian, degenerate) metric.

#### Theorem (1)

Let g,  $\omega$  be holomorphic functions defined on a simply connected open subset  $\mathcal{U} \subset \mathbb{C}$  such that  $\omega$  does not vanish on  $\mathcal{U}$ . Then

$$f(z) = Re \int \begin{pmatrix} (1+g^2) \omega \\ i(1-g^2) \omega \\ 2g\omega \end{pmatrix} dz$$

is a spacelike conformal immersion with mean curvature identically 0 (i.e. spacelike conformal maximal surface). Conversely, any spacelike conformal maximal surface can be described in this manner.

**Remark (1).** A pair of a holomorphic function g and a holomorphic function  $\omega$ ,  $(g, \omega)$  is called Weierstrass data for a maximal surface. In Section 4, we also call  $(g, \omega)$  the Weierstrass data for CMC 1 surfaces in  $\mathbb{H}^3$  and  $\mathbb{S}^{2,1}$ .

• We call maximal surfaces  $\mathfrak{B}_m$   $(m \in \mathbb{Z}_{\geq 2} := \{n \in \mathbb{Z} | n \geq 2\})$  given by  $(g, \omega) = (z, z^{m-2})$  the spacelike Bour's maximal surfaces  $\mathfrak{B}_m$  of value m (spacelike  $\mathfrak{B}_m$ , for short).

Next, we give the Weierstrass-type representation for timelike minimal surfaces in  $\mathbb{R}^{2,1}$ , which was obtained by M. Magid [14] (see also Inoguchi and Lee [10]).

### Theorem (2)

Let  $g_1(u)$ ,  $\omega_1(u)$  (resp.  $g_2(v)$ ,  $\omega_2(v)$ ) be smooth functions depending on only u (resp. v) on a connected orientable 2-manifold with local coordinates u, v. Then

$$\hat{f}(u,v) = \int \begin{pmatrix} 2g_1\omega_1 \\ (1-g_1^2)\omega_1 \\ -(1+g_1^2)\omega_1 \end{pmatrix} du + \int \begin{pmatrix} 2g_2\omega_2 \\ (1-g_2^2)\omega_2 \\ (1+g_2^2)\omega_2 \end{pmatrix} dv.$$

is a timelike surface with mean curvature identically 0 (i.e. timelike minimal surface). Conversely, any timelike minimal surface can be described in this manner.

The timelike minimal surfaces given by  $(g_1(u), \omega_1(u)) = (u, u^{m-2}), (g_2(v), \omega_2(v)) = (v, v^{m-2})$  are called timelike Bour surfaces  $\mathfrak{B}_m$  of value m (timelike  $\mathfrak{B}_m$ , for short) in  $\mathbb{R}^{2,1}$ , where  $m \in \mathbb{Z}_{\geq 2}$ .

The parametrization of timelike  $\mathfrak{B}_m$  is

$$\mathfrak{B}_{m}(u,v) = \begin{pmatrix} \frac{\frac{2}{m}(u^{m} + v^{m})}{\frac{1}{m-1}(u^{m-1} + v^{m-1}) - \frac{1}{m+1}(u^{m+1} + v^{m+1})}, \\ -\frac{1}{m-1}(u^{m-1} - v^{m-1}) - \frac{1}{m+1}(u^{m+1} - v^{m+1}) \end{pmatrix},$$

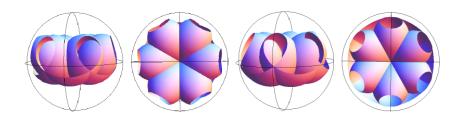

Figure 4. Left two pictures:  $\mathfrak{B}_6$  cousin in  $\mathbb{H}^3$ , right two pictures: its dual cousin in  $\mathbb{H}^3$ 

Proof.

Equation (3) gives

$$X'' - \frac{\omega'}{\omega}X' - g'\omega X = 0, \quad (X = a(z), c(z))$$
 (5)

$$X'' - \frac{\omega'}{\omega} X' - g' \omega X = 0, \quad (X = a(z), c(z))$$
 (5)  
$$Y'' - \frac{(g^2 \omega)'}{g^2 \omega} Y' - g' \omega Y = 0 \quad (Y = b(z), d(z)),$$
 (6)

which are given by Umehara and K. Yamada [18]. Here we solve Equation (5).

Proof. (cont.) Inserting  $(g, \omega) = (z, z^{m-2})$  into Equation (5), we have

$$X'' - \frac{m-2}{z}X' - z^{m-2}X = 0. \ (m \in \mathbb{Z}_{\geq 2})$$
 (7)

Proof. (cont.)

We give two independent power series solutions of the differential equation (7) by the Frobenius method. The indicial equation at z=0 is  $\rho(\rho-1)-(m-2)\rho=0$ . So we see that the characteristic exponents of the equation (7) are 0 and m-1.

Proof. (cont.)

Then we have a solution of the form

$$z^{m-1}\sum_{p=0}^{\infty}a_pz^p,$$

where the coefficients  $a_p$  are inductively given by

$$\begin{aligned} a_{mk+l} &= 0 \quad (l = 0, \cdots, m), \\ a_{mk+m+1} &= \frac{a_{m(k-1)+m-1}}{(m-2)k(mk+m-1)} \\ &= \frac{\Gamma(\frac{m-1}{m} + k)}{m^2\Gamma(\frac{m-1}{m} + k + 1)} a_{m(k-1)+m-1} \quad (l \ge m+1). \end{aligned}$$

Proof. (cont.)

Therefore we obtain a solution of the differential equation (7):

$$z^{\frac{m-1}{2}} \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(\frac{m-1}{m}+k+1)} \left(\frac{z^{\frac{m}{2}}}{m}\right)^{2k+\frac{m-1}{m}}$$

$$= z^{\frac{m-1}{2}} \operatorname{Bessel} \operatorname{I}\left(\frac{m-1}{m}, \frac{2}{m}z^{\frac{m}{2}}\right).$$

Proof. (cont.)
Similarly, we obtain another independent solution as

$$z^{\frac{m-1}{2}} \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(-\frac{m-1}{m} + k + 1)} \left(\frac{z^{\frac{m}{2}}}{m}\right)^{2k - \frac{m-1}{m}}$$

$$= z^{\frac{m-1}{2}} \operatorname{Bessel} \operatorname{I}\left(-\frac{m-1}{m}, \frac{2}{m}z^{\frac{m}{2}}\right).$$

So we have two independent solutions of Equation (5). Next, we find two independent solutions of Equation (6).

Proof. (cont.) Similarly to the way we solved Equation (5), we have two independent solutions

$$z^{\frac{m+1}{2}}\operatorname{Bessel}\operatorname{I}\left(\frac{m+1}{m},\frac{2}{m}z^{\frac{m}{2}}\right),\quad z^{\frac{m+1}{2}}\operatorname{Bessel}\operatorname{I}\left(-\frac{m+1}{m},\frac{2}{m}z^{\frac{m}{2}}\right).$$

### CMC 1 Bour type surfaces

Proof. (cont.) Using the initial conditions, we have the solution F as in Equations (4).

**Remark (2).** If F is a solution of Equation (3), the surface

$$f^\sharp = (F^{-1})\overline{(F^{-1})}^t \quad \left( \text{resp. } f^\sharp = (F^{-1}) egin{pmatrix} 1 & 0 \ 0 & -1 \end{pmatrix} \overline{(F^{-1})}^t 
ight)$$

is also a CMC 1 surface in  $\mathbb{H}^3$  (resp.  $\mathbb{S}^{2,1}$ ).

This was proven by Umehara and Yamada [19] (resp. Lee [13]). The surface  $f^{\sharp}$  is called the CMC 1 dual of f.

Using the explicit parametrization of the  $\mathfrak{B}_m$  cousin, we can easily show the following corollary, which implies the rotational symmetric property of the  $\mathfrak{B}_m$  cousins in  $\mathbb{H}^3$ ,  $\mathbb{S}^{2,1}$ .

### Corollary (1)

Let  $F(z) \in SL_2\mathbb{C}$  be the form as in Theorem 5 with complex coordinate z. Then

$$F(e^{i\frac{2\pi}{m}}\cdot z) = \begin{pmatrix} a(z) & e^{i\frac{2\pi}{m}}\cdot b(z) \\ e^{-i\frac{2\pi}{m}}\cdot c(z) & d(z) \end{pmatrix}.$$

Writing  $\mathfrak{B}_m$  cousin in  $\mathbb{H}^3$  or  $\mathbb{S}^{2,1}$  as  $f(z) = (x_1(z), x_2(z), x_3(z), x_0(z))^t$ , given by Theorem 5, and setting  $f\left(e^{i\frac{2\pi}{m}} \cdot z\right) = (\hat{x}_1(z), \hat{x}_2(z), \hat{x}_3(z), \hat{x}_0(z))^t$ .

## CMC 1 Bour type surfaces

By Corollary (1), we have

$$\begin{split} \hat{x}_1(z) &= \cos\left(\frac{2\pi}{m}\right) x_1(z) - \sin\left(\frac{2\pi}{m}\right) x_2(z),\\ \hat{x}_2(z) &= \sin\left(\frac{2\pi}{m}\right) x_1(z) + \cos\left(\frac{2\pi}{m}\right) x_2(z),\\ \hat{x}_3(z) &= x_3(z), \ \hat{x}_0(z) = x_0(z), \end{split}$$

that is, by rotating z by angle  $\frac{2\pi}{m}$ , the first and second coordinates are also rotated by the same angle.

where  $P_m(u, v)$  denotes the function as in Equation (8) for spacelike or timelike  $\mathfrak{B}_m$ .

• The inhomogeneous tangential coordinates are

$$a = \frac{6u}{\alpha(u, v)}, \ b = \frac{6v}{\alpha(u, v)}, \ c = \frac{6(u^2 + v^2 + 1)}{\alpha(u, v)},$$

where 
$$\alpha(u, v) = (u^2 + v^2 - 3)(u - v)(u + v)$$
.

• In the tangential coordinates a, b, c,

$$\begin{split} \hat{Q}_2(a,b,c) &= 4a^6 + 9a^4 + 9b^4 + 6a^2b^2c^2 + 12b^2c^3 \\ &-3b^4c^2 - 18b^4c - 4a^4b^2 + 18a^4c - 12a^2c^3 \\ &-4a^2b^4 - 3a^4c^2 + 18a^2b^2 - 4a^2b^4 + 4b^6, \end{split}$$

where  $\hat{Q}_m(a,b,c)=0$  denotes the irreducible implicit equation for spacelike or timelike  $\mathfrak{B}_m$  in terms of tangential coordinates

• Therefore, the class of the spacelike  $\mathfrak{B}_2$  is  $cl(\mathfrak{B}_2)=6$ .

Similarly,

$$\mathfrak{B}_{3}\left(u,v\right) \ = \ \begin{pmatrix} \frac{u^{4}}{4} + \frac{v^{4}}{4} - \frac{3}{2}u^{2}v^{2} + \frac{u^{2}}{2} - \frac{v^{2}}{2} \\ u^{3}v - uv^{3} - uv \\ \frac{2}{3}u^{3} - 2uv^{2} \end{pmatrix} = \begin{pmatrix} x(u,v) \\ y(u,v) \\ z(u,v) \end{pmatrix},$$

To find the class of surface  $\mathfrak{B}_2$  we obtain

$$P_2(u, v) = \frac{(uv + 3)(u^2 + v^2)}{3(uv + 1)},$$

and the inhomogeneous tangential coordinates are

- (5.1) Degree and class of spacelike Bour of value 2,3,4 in  $\mathbb{R}^{2,1}$
- (5.2) Degree and class of timelike Bour of value 2,3,4 in  $\mathbb{R}^{2,1}$

$$a = -\frac{(uv - 1)(3uv + 3)}{\hat{\alpha}(u, v)}$$

$$b = -\frac{(u + v)(3uv + 3)}{\hat{\alpha}(u, v)},$$

$$c = -\frac{(u - v)(3uv + 3)}{\hat{\alpha}(u, v)},$$

where 
$$\hat{\alpha}(u, v) = (uv + 1)(uv + 3)(u^2 + v^2)$$
.
