**Abstract.** A mapping between the stationary solutions of nonlinear Schrödinger equations with real and complex potentials is constructed and a set of exact solutions with real energies are obtained for a large class of complex potentials. As specific examples we consider the case of dissipative periodic solutions of the nonlinear Schrödinger equation with complex potential.

## 1. Introduction

Nonlinear wave phenomena with time evolutions governed by non hermitian Hamiltonians are presently attracting a great interest both from the theoretical and the applicative point of view. The non hermiticity is in general due to the presence of a complex potential in the Hamiltonian accounting for typical dissipative and amplification effects met in classical and quantum contexts [5, 12]. In particular, dissipative solitons [4] of the nonlinear Schrödinger (NLS) equation with periodic complex potentials have been extensively investigated during the past years in connections with the propagation of light in nonlinear optical fibers with periodic modulations of the complex refractive index [13, 18]. Recently similar studies were done for matter wave solitons of Bose-Einstein condensates (BEC) trapped in absorbing optical lattices [1, 7] and in the presence of three body interatomic interactions [3]. In the linear context, the recent discovery [6] that the Schrödinger eigenvalue problem with complex potentials that are invariant under the combined parity and time reversal symmetry (so called  $\mathcal{PT}$ -potentials), may have fully real spectrum, has raised interest also in view of possible connection with the theory of quantum dissipative systems [10]. Complex potentials with  $\mathcal{PT}$ -symmetry are presently investigated in nonlinear optics [11] where it has been demonstrated that nonlinear media with *linear* damping and amplifications that are  $\mathcal{PT}$ -symmetric can support stable stationary localized and periodic states [14]. Also, quite recently, physical systems with  $\mathcal{PT}$ -symmetry have been successfully implemented in real experiments [9, 15, 17]. Solutions of the NLS equation with a complex potential which belong to the real part of the spectrum (real energies or real chemical
