## Abstract

If the space-time is a product of the space and the time the Poisson structure on the phase bundle is used to describe dynamics of mechanical systems. Further it is shown that if the space-time is a fibration over the time, then the Poisson structure has to be replaced by an affine Poisson structure.

## 1. TIME-DEPENDENT SYSTEMS

## **1.1. Time Independent Systems**

In order to define a time-independent system the space-time has to be the product of space and time represented by the real line  $\mathbb{R}$ . For a time-independent system with configuration manifold Q, the infinitesimal dynamics is a submanifold D of  $\mathbf{TT}^*Q$ . In particular cases D is the image of a vector field. The cotangent bundle  $\mathbf{T}^*Q$  with the canonical 2-form  $\omega_Q$  is a symplectic manifold.<sup>1-3</sup> The tangent bundle  $\mathbf{TT}^*Q$  of the cotangent bundle with the tangent 2-form  $d_{\rm T}\omega_{\rm O}$  is a symplectic manifold as well.<sup>4,5</sup> We say that the system is Lagrangian if the dynamics D is a Lagrange submanifold of  $(\mathbf{TT}^*Q, d_{\mathbf{T}}\omega_{\mathcal{O}}).$ 

Let us denote by  $\tau_Q$  the canonical projection  $\tau_Q: \mathbf{T}Q \to Q$  and by  $\pi_Q$  the canonical projection  $\pi_{\rho}: \mathbf{T}^* Q \to Q$ . There are three, fundamental for the analytical mechanics, isomorphisms of vector bundles:

$$\kappa_{Q}: (\tau_{\mathsf{T}Q}:\mathsf{T}\mathsf{T}Q \to \mathsf{T}Q) \longrightarrow (\mathsf{T}\tau_{Q}:\mathsf{T}\mathsf{T}Q \to \mathsf{T}Q) \tag{1.1}$$

$$\begin{aligned} &\kappa_{Q}: (\mathbf{T}_{\mathbf{q}}:\mathbf{T}_{\mathbf{Q}}:\mathbf{T}_{\mathbf{Q}}:\mathbf{T}_{\mathbf{Q}}\to\mathbf{T}_{\mathbf{Q}}) &\longrightarrow (\mathbf{T}_{\mathbf{q}}:\mathbf{T}_{\mathbf{Q}}\to\mathbf{T}_{\mathbf{Q}}) \\ &\alpha_{Q}: (\mathbf{T}_{\mathbf{q}}:\mathbf{T}_{\mathbf{Q}}:\mathbf{T}_{\mathbf{Q}}\to\mathbf{T}_{\mathbf{Q}}) &\longrightarrow (\pi_{\mathbf{T}_{\mathbf{Q}}}:\mathbf{T}_{\mathbf{T}}^{*}\mathbf{T}_{\mathbf{Q}}\to\mathbf{T}_{\mathbf{Q}}) \end{aligned}$$
(1.1)

$$\beta_{Q}: (\mathbf{T}\pi_{Q}:\mathbf{T}\mathbf{T}^{*}Q \to \mathbf{T}Q) \longrightarrow (\pi_{\mathbf{T}^{*}Q}\mathbf{T}^{*}\mathbf{T}^{*}Q \to \mathbf{T}^{*}Q)$$
(1.3)

The mapping  $\alpha_Q$  is also a symplectomorphism of  $(\mathsf{TT}^*Q, \mathsf{T}\pi_Q)$  and  $(\mathsf{T}^*\mathsf{T}Q, \pi_{\mathsf{T}Q})$ . The mapping  $\beta_Q$  is a symplectomorphism of  $(\mathbf{TT}^*Q, \mathbf{T}\pi_Q)$  and  $(\mathbf{T}^*\mathbf{T}^*Q, \pi_{\mathbf{T}^*Q})$ .

Let the dynamics D of a system be a Lagrangian submanifold of  $(\mathbf{TT}^*Q, \mathbf{T}\pi_Q)$ . It follows that  $\alpha_Q(D)$  and  $\beta_Q(D)$  are Lagrangian submanifolds of  $(\mathbf{T}^*\mathbf{T}Q, \pi_{\mathbf{T}Q})$  and  $(\mathbf{T}^*\mathbf{T}^*Q, \pi_{\mathbf{T}^*O})$  respectively. By a theorem of Hörmander  $\alpha_Q(D)$  and  $\beta_Q(D)$  can be
